The traditional building layout on plots is still very much visible on the map, mainly present near the main road; said composition, when multiplied and situated next to one another, creates an interesting continuous facade of barns.

RUDZIENKO

initial condition analysis

Stefan Łuczynowicz, Gabriel Pietruszka,
Dagmara Legieć, Aleksander Olędzki

A small village in the eastern part of Poland called Rudzienko was a place of rich agricultural heritage with several niches of produce. Under the influence of industrialization, specifically, development of new streets over functional fields, village's characteristic plot arrangement lost its functional ability.

farmhouse > cowshed > barn > field access

First thing that meets the eye while visiting the village are the varieties on how the barn back wall ventilation system is designed. Each pattern is unique and in some way resembles a small part of the village's culture and the individuality of each former and active farmer.

While the barn designs can be different, Rudzienko's main production is reduced to cultivating chickens and producing hay.

Each part of Rudzienko will be dedicated to its own function which were chosen based on the landscape and existing state of plot arrangement, creating districts that will function independently, as well as exchanging goods with each other and providing a broad range of activities for anyone that will come to visit the village any time of the year.

URBAN RETREAT

concept of Rudzienko village development

This zone occupies the expansive western portion of the site, characterized by large, continuous agricultural fields. It is dedicated to the cultivation and seasonal harvesting of crops such as wheat and other cereals. The layout emphasizes efficiency and openness, with elongated plots that reflect traditional farming practices while also allowing visitors to observe and participate in harvesting activities.

This area serves both as a working agricultural landscape and an educational space, showcasing the rhythms of rural cultivation and the importance of local food production.

Located along the central axis, this zone acts as a bridge between production and experience. The spatial arrangement is organic and clustered, encouraging exploration and interaction. Small workshops and courtyards create an intimate, human-scale environment where visitors can engage directly with artisans. As this zone does not have any pre-defined crafts, it provides residents with complete freedom to choose their own activities.

Situated along the water body at the southern edge, this zone focuses on recreation, relaxation, and fishing activities. The presence of water defines its character, this zone offers a slower, more reflective experience, allowing visitors to connect with nature and the local ecosystem. It complements the more active agricultural and workshop areas by providing a space for rest and leisure.

Our idea of developing the village focuses on bringing back the traditional value of cultivation, farming and returning the vital spirit to Rudzienko, which will help to attract new residents, as well as people from urban areas who seek temporary relaxation, peace and reunishment with nature.

The development will mainly touch elongated empty plots with access to the fields which will be done according to traditional layout: farmhouse > cowshed > barn. Due to the shortage of suitable plots, each developed one will serve as a dominating landmark for the local area because of its unique function.

Our outcome is also planned long-term, resulting in local residents engaging with activities of each dominant, providing their unused land on their own plot for the benefits, which will expand each industry and Rudzienko's life even further.

Common Ground

Ceramic Craft Farmstead in Rudzienko

The project is located in the small Polish village of Rudzienko and introduces a pottery workshop dedicated to hand-crafting ceramics and firing finished objects, creating a space where traditional material practices are reactivated within a contemporary rural context.

The key architectural decision is to embed the project into a distinct natural depression in the landscape. Rather than resisting this topography, the design works with it, placing the workshop buildings along the edges of the hollow, creating the impression that the buildings are growing out of the slope, as if they were a natural part of the terrain.

As a result, the project becomes more than just a group of buildings, it is harmoniously integrated with the surrounding space. The sunken terrain acts as a protective amphitheater-like haven, enhancing focus, intimacy, and a sense of retreat, while also grounding the craft process in a strongly local and materially sensitive environment.

functional and spatial diagram of the pottery studio

1 soaking zone

This area is used for preparing the clay by soaking, mixing, and refining the material. Stored in a study and humid room has a positive effect on its properties and freshness.

2 sculpting zone

The main workshop area, where clay is shaped by hand or on pottery wheels. The space is designed for both production and participation, allowing visitors to engage directly in the forming process.

3 drying zone

A space, where formed objects are left to dry naturally, fully protected from sunlight, this zone acts as a transitional stage between sculpting and firing, preparing clay for high-temperature processing.

4 firing zone

A room equipped with a ceramic kiln, where dried pottery is transformed through high-temperature firing. This stage defines the final product, marking the key moment in the production process where raw forms become finished ceramic creations.
